

Standalone Digital account for every human

[Assem Hijazi – Experience, Knowledge & Ideas](#)

Article No 114-#AssemHijazi

The Digital Human System Is Already Built

And It's Time the World Paid Attention

Why the Digital Human System Isn't Just Important — It's Urgent

In my last article, I spoke about the need for a **decentralized future** — a future where every human has their own digital account, outside the control of any platform, government, or app.

[The future belongs to a decentralized digital system. | LinkedIn](#)

[The human centric system | LinkedIn](#)

Today, that need has turned into a **critical necessity**.

Let's face it: we live in a world of fragmented identities.

Every time you sign into a new app or access a service — whether it's healthcare, banking, travel, or even government platforms — you're asked to re-enter your phone number, ID, passport, credit card, or personal profile. Every system creates a **new version of you**. And none of them talk to each other.

These systems aren't designed for humans — they're designed for **revenue**. They don't care if you have control over your data. They don't even offer you a unified copy of your digital self. They just want your attention, your data, your time — again and again.

Even government efforts, while well-intentioned, are **painfully complex**. Some countries have built centralized IDs, yes. But even accessing basic services with those IDs feels like a maze of credentials and bureaucracy.

Now let's talk about **healthcare** — one of the most important areas of our lives. Can you, right now, access a full digital copy of:

- Your medical history?
- All your prescriptions?
- Your test results from every clinic you've ever visited?

You can't. Not in one place. Not even close.

Now add **AI** to the mix.

We're being asked to create accounts with AI assistants, feed them private data, and trust them to serve us — when they don't even know us. And with deepfakes and AI-generated media, the digital world is becoming more **untrustworthy** by the day.

Yet, **nobody has built a global system** that can confirm if a video is real. Or if a digital interaction is truly from a human.

So let me ask you this:

Why can't a human just enter their data *once* — and use it everywhere? Why can't apps and systems be **required** to replicate a copy of that data back to the person? Why doesn't the human have **a single, certified digital identity** they control — verified by their own biometrics?

You know the answer: **Because the current internet isn't built for that.**

But what if I told you... **It's already solved. It's already built.** And it's called the **Digital Human System.**

Is It Even Possible to Give Every Human a Decentralized Account?

Let's be honest — if you come from today's digital world, where everything is built around centralized platforms and isolated systems, this probably sounds **impossible**.

How could every human on Earth have:

- Their **own dedicated account**?
- **Total privacy**?
- And systems that are required to **integrate with them**, not the other way around?

It sounds strange — maybe even unrealistic.

But that's only because the **architecture we all grew up with** wasn't designed for this.

Everything you see today — the mess with personal data, repeated profiles, weak security, digital ID confusion — it all comes from the **original design flaws of the internet** and the **centralized model of digital systems**.

Why It's Not Easy — But Absolutely Necessary

What I've created is **not a plugin**. It's not just an API. It's an entirely **new system architecture**, designed to work *with* the internet but **correct its biggest flaw**:

The internet was never designed for humans to own their data. And it was definitely never designed for AI.

🔗 (Read more on this here: [*The Internet Was Never Built for AI*](#))

So yes — creating a **human-centric decentralized system** is a huge challenge. It's not something a single country or company can build alone. It requires:

- A shift in mindset
 - Global collaboration
 - Government cooperation
 - And serious tech sponsorship
-

So What Did I Build?

Since 2020, I've worked on this full-time — quietly but continuously.

- The **architecture was completed in 2023**
- The **Digital Human System is ready**
- It doesn't break the current internet — instead, it adds a "**Light Web**" layer on top of it (not a dark web — a human-centric, ethical, transparent digital layer)

This "Light Web" is built to:

- Integrate with existing platforms
 - Respect national systems
 - Empower users without requiring them to understand the complexity behind it
-

What's Next?

What the system now needs is:

- A major **global sponsor or host country** willing to lead the way
- A coalition of stakeholders who understand that the current digital model is broken
- Visionaries who know this isn't just about tech — **this is about digital humanity**

I'm already in motion on that. And if you're reading this and thinking *maybe it's possible* — you're already part of the shift.

Just a Few Hints... Much More to Come

What I've shared so far is just the surface — a glimpse. The full architecture of the **Digital Human System** is vast. It's something that **can't be captured in even 100 articles**.

But I promise, in the coming series, I'll start unpacking the most critical parts.

And I'll begin with the deepest technical foundation of the system — what I call the “**Apps-Chain Mode.**”

This is not just a framework. It's the engine that allows apps, systems, and human accounts to operate in sync — securely, privately, and decentralized.

Stay tuned. What's coming next will shift how you see the digital world.
