

The future belongs to a decentralized digital system.

[Assem Hijazi – Experience, Knowledge & Ideas](#)

April 29, 2024

There is an immense need for a more human-centric system worldwide, a system that provides independent infrastructure for every individual and delivers the genuine benefits of the digital era to humanity.

This system must provide an independent account for every person, alongside centralized data management for each individual. It should empower individuals to control their own data and safeguard their data privacy.

In the digital era, each country requires tailored support and access to both decentralized and centralized systems to develop and bolster its digital economy. This includes social media platforms, centralized digital communication systems, and others.

Existing centralized systems do not prioritize human-centricity, neither for individuals nor for countries.

There is a necessity to develop a new architecture and system to establish a human-centric system for every individual and every country.

With the advent of the new era of AI and GenAI, there is a significant need to protect human privacy and provide greater support for both individuals and countries.

Developing such an architecture for a system is challenging and requires significant collaboration between technology companies and each country individually. The system architecture should be implemented globally, fostering integration between the systems of each country to create an integrated, human-centric digital system.

The digital human system is the future human-centric system for the world.
